

# Zero Trust Cybersecurity Standard - Technical Architecture

## 1. Core Zero Trust Principles

The corporate network adheres strictly to the NIST SP 800-207 Zero Trust Architecture.

Implicit trust based on network locality is completely eradicated; every access request is authenticated, authorized, and encrypted.

## 2. Identity Verification & MFA

FIDO2 / WebAuthn hardware security keys are mandatory for all administrative access.

Session lifetimes for privileged user roles are capped at 4 hours before requiring step-up authentication.

# Zero Trust Network & Microsegmentation

## 3. Network Microsegmentation

Production workloads are segmented using software-defined perimeters (SDP).

Direct east-west traffic between database clusters and presentation tiers is strictly restricted to designated mTLS ports.
